

Maxtor OneTouch External Drive and Huge Files

Kirk Evans[MSFT] 21 Apr 2005 4:40 PM

6

I bought the Maxtor OneTouch external HDD, a 200 GB beauty, to try to manage my increasibly unmanageable number of VPCs that I need to run at any time. The typical VPC that I use seems to run somewhere around 5 GB - 6 GB, depending on what I did to the image.

Every time I try to write the .VHD file to the external drive, I get a "disk full" error. I bought a USB 2.0 card for my laptop (highly recommended, this thing speeds up USB transfers SO much!) I thought that it was possibly some weirdness with the transfer going over USB 1.1 and being so slow. The USB 2.0 card definitely speeds it up, but I still get the error.

After looking for awhile, I found [the answer on Maxtor's web site](#):

Windows will report this error when writing to a file that has reached the maximum size for that File System.

*FAT32 has a 4GB (gigabyte) limit.
NTFS has a 1TB (terabyte) limit.*

1394 and USB Personal Storage drives are pre-formatted in FAT32. Therefore, if the backup file is larger than 4GB, a file size error will occur.

Great. Except that I have already written a huge amount of data to this thing. I found documentation for [convert.exe to convert from FAT32 to NTFS](#), hoping without losing my data. Crossing my fingers....

Update: Whew! Worked like a champ. Convert.exe converted to NTFS, no problems (although I had to run chkdsk on the volume first), and now I can copy files greater than 4 GB. Sweet.

You know I would be interested in later on how you find the performance on this drive. I have had one for about a month now and not really used it until all the beta 2 release stuff this week. So I have been building up VPC's on that thing to go whole hog on the beta two stuff. Unfortunately I find the performance unusually slow. Specifically with disk writes and so on.

An Example is Open my computer see it listed there as Drive G I double click on it and fast as a flash displays all the root directories there on G:\. Now I double click on a directory and it can actually take sometimes up to 5 seconds for that directory to actually open to display my 2 files in there. Sometimes firing up a VPC it takes about 5 seconds for it to even respond and start booting. Now it doesn't do this with any of my internal drive just this one. I have double checked and updated bios and drivers and everything I can think of and I know my 4 gigs of ram and hyperthreaded CPU can handle the load. Just seems wierd.

I had the same thing happen to me when I purchased my first external drive. Ever since then the first thing I do when I buy one is format it NTFS.

MSDNArchive 29 Apr 2005 12:27 PM

Ditto here - after running into it once, I'm just doing the NTFS conversion up front. I thought that while waiting for the conversion I should re-read Helen Custer's booklet on NTFS. ;)
